Isolated interleukin 20 soluble receptor comprising two polypeptide subunits IL-20RA and IL-20RB, useful for down-regulating IL-20 and thus treating inflammatory diseases such as psoriasis.

Claim 1; Page 65; 119pp; English.

The invention relates to an interleukin 20 (II-20) soluble receptor comprising two polypeptide subunits II-20RA (formerly known as ZcytoR7) and II-20RB (formerly known as DIRS1). The two subunits are preferably linked together. In one embodiment, one subunit is fused to the constant region of the light chain of an immunoglobulin, and the other subunit is fused to constant region of the heavy chain of an immunoglobulin. The light chain and the heavy chain are connected via a disulphide bond. The soluble receptor can be used to down-regulate II-20 and thus treat inflammatory diseases such as psoriasis, inflammatory lung injury such as or bronchitis, adult respiratory disease (ARD), septic

The invention describes a method (I) for treating a mammal afflicted with CC a disease in which an interleukin-20 (II-20) polypeptide plays a role comprising administering antagonist of the II-20 polypeptide to the CC comprising administering antagonist of the II-20 polypeptide to the CC cindividual. An important cytokine in the inflammatory process is CC via chemotaxis and the release of granule enzymes. II-8 binds to receptors on neutrophils, monocytes, basophils, and eosinophils. II-8 is a potent inducer of angiogenesis in several angiogenesis dependent chemoattractant for neutrophils, and the early stages of CC periodontal disease are characterised by the influx of neutrophils. II-8 is an optent inducer of angiogenesis in several angiogenesis-dependent chemoatric productions, including rheumatoid arthritis, CC psoriasis, and idiopathic pulmonary fibrosis. Additionally, II-8 is an CC important source of angiogenic activity in human lung cancer. Also, II-8 cxpression correlates with experimental metastatic activity of some CC expression correlates with experimental metastatic activity of some CC diseases would be to administer an agent that would inhibit II-8. It has CC been shown that II-20 up-regulates II-8. Therefore antagonists to II-20 cliseases in which the II-20 polypeptide plays a role e.g. inflammatory CC diseases including diabetes, arteriosclerosis, cataracts, reperfusion CC diseases inflammatory bowel disease (lacerative colitis), skin disease (psoriasis, cataracts, reperfusion CC inflammatory lung disease (adult respiratory disease (ARD), asthma, CC bronchitis and pneumonia). This sequence represents a human interleukin-CC (III-20) polypeptide used in developing the method of the invention cc (III-20) polypeptide used in developing the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating inflammatory skin and lung diseases using antibodies against interleukins (IL)-20 (which indirectly modulates activation of IL-8), useful for treating e.g. psoriasis, asthma and bronchitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure; Page 21-22; 68pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2002-507215/54.

The method involves administration of a polypeptide comprised of the extracellular domain of interleukin-20 receptor alpha (IL-20RA) and the extracellular domain of interleukin-20 receptor beta (IL-20RA). The IL-20RA and IL-20RB are heterodimeric receptors that bind to both IL-19 and mda7. The method is useful for down-regulating IL-19, useful for the treatment of inflammation e.g., in diabetes, artherosclerosis, cataracts, reperfusion injury, cancer, infectious meningitis, rheumatoid arthritis, rheumatic fever and systemic lupus erythematosus. The present sequence is human IL-20RA mature extracellular protein

                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is the protein sequence of the human soluble interleukin-20 (IL20) receptor alpha subunit. The invention provides a method for the treatment and/or prevention of inflammation, immune system, cardiovascular and haematopoietic disorders and regulation of cellular proliferation by inhibiting the binding of a cytokine (e.g., interleukin-19, interleukin-20 and/or interleukin-24) to its receptor complex, thereby preventing signal transduction. The method uses purified soluble receptor proteins, such as the soluble IL20 receptor alpha subunit. A pharmaceutical composition comprising the polypeptide, or a fusion protein including the polypeptide, is useful for modulating the physiology or development of a cell in vivo, in vitro and/or in situ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Treating or preventing inflammation, immune system, cardiovascular and hematopoietic disorders, and regulation of cellular proliferation comprises administering proteins inhibiting cytokine signaling, e.g.

The PRO polypeptides are useful to detect other PRO CC polypeptides, to link bioactive molecules to cells expressing PRO CC polypeptides, to modulate biological activities of cells expressing PRO CC polypeptides, and to detect the presence of mammalian lung, colon, CC breast, prostate, rectal, cervical or liver tumours by comparing PRO CC polypeptide expression in a cell sample to that in a control sample. Some CC of the 275 sequences are also useful to stimulate the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, the proliferation or concerns a sequence of proteoglycans from cartilage, the proliferation or gene expression in CC pericyte cells, the release of proteoglycans from cartilage, the CC lymphocytes, the release of a cycokine from peripheral blood monocytes (PBMCs), or the proliferation of endochelial cells. Some of the PRO CC polypeptides may modulate glucose or free fatty acid uptake by skeletal CC muscle cells or by adipocytes; or inhibit binding of A-peptide to factor CC VIA. The PRO polypeptides can be used to generate probes, antisense RNA/DNA, CC transgenic or knock out animals and can be used in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

Novel nucleic acids encoding PRO polypeptides, used to presence of tumors, such as prostate and breast tumors, screen for modulators of the compounds. diagnose the , in mammals the and ç

Claim 11; Fig 398; 774pp; English.

Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention. The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the anima and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate animal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders

N-PSDB; New secreted and transmembrane PRO nucleic acids, for inflammation, organ failure, atherosclerosis, cardiac infertility, birth defecte, premature aging, axquired syndrome (AIDS), or cancer. injury, immunodeficiency treating

Claim 12; Fig 188; 660pp; English.

The invention describes an isolated nucleic acid (I) comprising, or which has 80 % sequence identity to, or the full-length coding sequence of, one of 275 nucleotide sequences, and which encodes a corresponding polypoptide selected from 275 amino acid sequences, where all sequences are given in the specification. The polypoptide encoded by (I) is used to detect PRO polypoptides, link a bioactive molecule to a cell expressing a PRO polypoptide, modulate a biological activity of a cell, stimulate the release of tumour necrosis factor (TNF) alpha from human blood, modulate the uptake of glucose or free fatty acid by cells, stimulate or inhibit or which e of, one a to

The nucleic diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, acquired immunodeficiency syndrome (AIDS), cancer, or diabetic complications. The nucleic acid is useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typing. This is the amino acid sequence of a novel human secreted and Sequence 542 AA; 199 139 181 121 79 61 19 Н PNTLYCVHVESFVPGPPRRAQPSEKQCARTLKDQSSEFKAK 221 SISVVLTAPEKWKRNPEDLPVSMQQIYSNLKYNVSVLNTKSNRTWSQCVTNHTLVLTWLE 180 INRTYCDLSAETSDYEHQYYAKVKAIWGTKCSKWAESGRFYPFLETQIGPPEVALTTDEK 120 SISVVLTAPEKWKRNPEDLPVSMQQIYSNLKYNVSVLNTKSNRTWSQCVTNHTLVLTWLE Length 542; Indels 0; Gaps 198 78 60 0;

Isolated interleukin 20 soluble receptor comprising two polypeptide subunits IL-20RA and IL-20RB, useful for down-regulating IL-20 and thus treating inflammatory diseases such as psoriasis.

Claim 1; Page 69; 119pp; English.

The invention relates to an interleukin 20 (II-20) soluble receptor comprising two polypeptide subunits II-20RA (formerly known as ZcytoR7) and II-20RB (formerly known as IRS1). The two subunits are preferably linked together. In one embodiment, one subunit is fused to the constant region of the light chain of an immunoglobulin, and the other subunit is fused to constant region of the heavy chain of an immunoglobulin. The light chain and the heavy chain are connected via a disulphide bond. The soluble receptor can be used to down-regulate II-20 and thus treat inflammatory diseases such as psoriasis, inflammatory lung injury such as asthma or bronchitis, adult respiratory disease (ARD), septic shock,

CC receptors on neutrophils, monocytes, basophils, and eosinophils. IL-8 is CC a potent chemoattractant for neutrophils, and the early stages of CC periodontal disease are characterised by the influx of neutrophils. IL-8 is CC is a potent inducer of angiogenesis in several angiogenesis-dependent CC chronic inflammatory conditions, including rheumatoid arthritis, CC psoriasis, and idiopathic pulmonary fibrosis. Additionally, IL-8 is an CC important source of angiogenic activity in human lung cancer. Also, IL-8 cc expression correlates with experimental metastatic activity of some CC expression correlates with experimental metastatic activity of some CC diseases would be to administer an agent that would inhibit IL-8. It has come considered the constant series of the series of the series of the stages. The method is used for treating constant these diseases. The method is used for treating considered the constant correct diseases including diabetes, arteriosclerosis, cataracts, reperfusion CC diseases including diabetes, arteriosclerosis, cataracts, reperfusion CC injury, cancer, meningitis, rheumatic diseases, idiopathic pulmonary concer, meningitis, rheumatic diseases, idiopathic pulmonary concer, meningitis, rheumatic diseases, idiopathic pulmonary confilmanatory bowel disease (ulcerative colitis), skin disease (psoriasis, eczema, atopic dermatitis and contact dermatitis) or an inflammatory lung disease (adult respiratory disease (ARD), asthma, bronchitis and pneumonia). This sequence represents a human interleukin-cc (IL-20) polypeptide used in developing the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a method (I) for treating a mammal afflicted with a disease in which an interleukin-20 (IL-20) polypeptide plays a role comprising administering antagonist of the IL-20 polypeptide to the individual. An important cytokine in the inflammatory process is interleukin-8 (IL-8), a chemokine that acts as an agonist for neutrophils via chemotaxis and the release of granule enzymes. IL-8 binds to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating inflammatory skin and lung diseases using antibodies against interleukins (IL)-20 (which indirectly modulates activation of IL-8), useful for treating e.g. psoriasis, asthma and bronchitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Blumberg

The method involves administration of a polypeptide comprised of the extracellular domain of interleukin-20 receptor alpha (IL-20RA) and the extracellular domain of interleukin-20 receptor beta (IL-20RA). The IL-20RA and IL-20RB are heterodimeric receptors that bind to both IL-19 and mda7. The method is useful for down-regulating IL-19, useful for the treatment of inflammation e.g., in diabetes, artherosclerosis, cataracts, reperfusion injury, cancer, infectious meningitis, rheumatoid arthritis, rheumatoid arthritis, rheumatic fever and systemic lupus erythematosus. The present sequence is human IL-20RB extracellular domain protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 comprises administration of a polypeptide comprised domain of IL-20RA and IL-20RB.

Human 06-MAY-2004

interleukin receptor IL-20RB

extracellular domain interleukin;

mature protein. IL-20RA subunit;

IL-20;

(first entry)

inflammation; single chain antibody;

                                                                                                                                                                                                                                                                                                       The invention relates to a novel method of reducing or treating inflammation in a mammal which comprises administering an antibody, antibody fragment or single chain antibody which specifically binds to a receptor of interleukin (II)-20 comprising an IL-20RA subunit and an IL-20RB subunit. The method of the invention has antiinflammatory, dermatological, antipsoriatic, antiarthritic, respiratory, antiasthmatic, applications and may be useful for reducing or treating an inflammatory including an inflammatory skin disease such as psoriasis, eczema, atopic dermatitis and contact dermatitis or an inflammatory lung disease such as adult respiratory distress syndrome, asthma, bronchitis and pneumonia, as well as arthritis, septic shock, multiple organ failure, inflammatory bowel disease, ulcerative colitis or Crohn's disease. The current sequence is that of the human IL-20RB subunit-related protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Reducing or treating inflammation, e.g. inflammatory lung disease, comprises administering an antibody, antibody fragment or single chain antibody that specifically binds to an interleukin (IL)-20RA subunit of

The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood cosgulation disorders, cancers (callular adhesion disorders. They may also be used to raise antibodies. AAZ33381 to AAZ34338, and AAY41685 to AAY41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                                New secreted and transmembrane polypeptides and useful for treating blood coagulation disorders, adhesion disorders.
                                                                                                                                                                                                                                                                                                                                                 WPI; 1999-551358/46.

                                                                                                                              The invention provides membrane-bound PRO polypeptides and polynucleotides encoding them. The PRO sequences of the invention were identified based on extracellular domain homology screening. The PRO sequences have homology with proteins including LDL receptors, TIE ligands and various enzymes. The membrane-bound proteins and receptor molecules are useful as pharmaceutical and diagnostic agents. Receptor immunoadhesins, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. The PRO encoding sequences are useful as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. PRO nucleic acid sequences will also be useful for the preparation of PRO polypeptides, especially by recombinant techniques
                                                                                                        Sequence

Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus.

Claim 33; Fig 54; 309pp; English.

The present invention describes sixty four human PRO proteins which can CC be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for CC proteins, anti-PRO antibodies, agonists and antagonists are useful for CC treating and diagnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, contecarthritis, juvenile chronic arthritis, spondyloarthropathies, CC systemic sclerosis, idiopathic inflammatory myopathies, Sjogran's CC syndrome, systemic vasculitis, sarcoidosis, autoimmune haemolytic contemune, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, CC immune-mediated renal disease, demyclinating diseases of the central and CC peripheral nervous systems, hepatobiliary diseases, inflammatory bowel CC disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune CC disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune CC represent for the lung, and transplantation associated diseases including CC represent PCR primers and hybridisation probes used in the isolation of CC represent human PRO polynucleotide and protein sequences given in the cCC exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence teg) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bioactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bioactive molecules to cells. AAC78600 to AAC78987 represent PCR primers and probes used in the isolation of the
                                                                                                                                                                                                                                                                      Protein
                                                                                                                                                                                                                                                                                                                                                                              cytostatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          respectively. The proteins, cDNA and their modulators can be used for the treatment of viral and bacterial infection, inflammatory and autoimmune disorders, vascular injury and inhibition of angiogenesis. In particular, TANGO 241 can be used to treat pancreatic disorders and TANGO 242 can be used to treat pancreatic disorders.
